

September 9, 2021 Well #5 Update

Construction of Water Treatment Facility for Well No. 5 is progressing according to schedule and budget. Building foundation walls and interior baffle walls for below-grade tanks are all completed. The main floor has been formed and placement of steel rebars is in progress. The concrete outlet structure for the two on-site lagoons has been completed and Lagoon # 1 has been excavated and shaped. Materials availability associated with current supply chain issues and slow delivery have created additional challenges.
