Project Introduction:

The applicant, Indian Ridge Realty Trust, is proposing to develop a 24 Unit Residential development, located off Indian Ridge Road South, in Holliston Massachusetts. The proposed project was filed with Massachusetts Housing pursuant to Massachusetts General Laws Chapter 40B. The 24 Units will be single family and duplex style dwellings. The existing property is undeveloped wooded area and consists of 12.67 acres.

The proposal is to construct a roadway from the end of Indian Ridge Road South to provide access and egress. The Project will be serviced by Town water, available public utilities and a common onsite sewage disposal system. The stormwater generated from the Project will be captured, conveyed, treated and mitigated on-site utilizing Best Management Practices.

The purpose of these calculations is to demonstrate design compliance of the Project's stormwater management system for water quality and quantity, specifically post-development peak discharge rates per the DEP's Stormwater Management Policy, the Town of Holliston Land Subdivision Regulations. As designed, the system will mitigate peak rates of runoff for storms up to and including the 100-year event under post-construction conditions.

Methodology/Sources of Data:

The overall storm water management plan for the project is designed to maintain the peak rate of storm water runoff and runoff volumes from the site after development. The Soil Conservation Service Modified Soil Cover Complex Method, the computer program "HydroCAD" by Applied Microcomputer Systems, and the procedures specified in Urban Hydrology for storm Small Watersheds were used to determine pre-and post-developed peak flow rates of runoff from the site. The storm events have been compiled from the Soil Conservation Services Technical Report No. 55 and the U.S. Department of Commerce Technical Paper (TP 40). The 2-year, 10-year, 25-year and 100-year storm events have been utilized for hydrology calculations. The rainfall data for the Type III, 24-hour storm events follow:

24-Hour Storm	Rainfall (inches)
2	3.20
10	4.80
25	5.50
100	7.0

The storm water runoff will be controlled through the use of "Best Management Practices" and in conformance with the MADEP Stormwater Management Policy. The proposed Project will result in an improvement over the existing conditions, by constructing a storm water management system that will provide treatment, groundwater recharge and reduce the peak rates of runoff and offsite runoff volumes.

The piped drainage system has been designed utilizing the Rational Method for the 25 year storm event to size street drains.

Soils:

The Natural Resources Conservation Service (NRCS), Hydrologic Soils Group Map for Middlesex county, Massachusetts indicates that the on-site soils consist of Charlton Hollis Rock-103D, and Canton Fine sandy loam-424C. Soil testing was conducted onsite to confirm soil conditions. The results where consistent with sandy-loam and percolation rates of 15.0 minutes per inch. The test concluded large boulders in the test holes and surface boulders throughout the site. Based on the soil testing it is opinion that the soil throughout the site area is consistent with a "B" type hydrologic Rating. Therefore the design for pre- and post-development was performed using a "B" soil type.

Existing Conditions Overview:

The Project is located at the end of Indian Ridge Road South and identified as Assessor Map 14, Block 3, Lot 1 containing approximately 12.6 +/- acres. The site is currently undeveloped wooded land. There is a bordering vegetated wetland area located along the southerly and easterly boundaries. The site slopes from the northwest portion to the southeast.

The existing site is divided into three (3) existing watershed subcatchment areas. The three subcatchment areas converge at the southeast portion of the property. See the attached Pre-Development Subcatchment Area Plan for delineations. Subcatchment E1 flows overland towards the southern wetland to an intermittent stream. E2 is centrally located and flows to the south and E3 flows toward the westerly wetland. The three subcatchments flow via. overland and brooks to the southeast portion of the site and are combined with Link DP1.

Proposed Conditions Overview:

The proposal is to contruct 24 Residential homes, both single family and duplex style. The proposed roadway is an extension of Indian Ridge Road South. The extension is a total length of 1,640 feet of roadway that loops around on itself within the site. The proposed stormwater drainage system is designed to capture the runoff utilizing catch basins, manholes and culverts to convey the stormwater to a drainage basin located at the beginning of the proposed roadway.

The proposed runoff areas have been divided into three (3) subcatchments. Subcatchment P1 discharges via overland flow towards southern wetland, Subcatchment P2 is centrally located and discharges to the drainage basin and Subcatchment P3 flows via overland to the westerly wetlands. The overall stormwater discharge from the site is combine in link DP2.

The proposed systems will reduce all post-development flow rates of runoff up to and including the 100-year event to existing levels at all abutting areas. Existing uncaptured off-site runoff not associated with the Project will continue to flow overland without change.

The following is summary comparison of Pre- and Post-Developed Rates and Volumes of Runoff:

	Summary of Peak Stormwater Runoff Rates:							
Design	Pesign 2-Yr Peak Flow 10-Yr Peak Flow 25-Yr Peak Flow 100-Yr Peak Flow						eak Flow	
<u>Point</u>	(cfs)		<u>(cfs)</u>		<u>(c</u>	<u>:fs)</u>	<u>(cfs)</u>	
	<u>Existing</u>	Proposed	<u>Existing</u>	Proposed	<u>Existing</u>	Proposed	<u>Existing</u>	Proposed
DP1/	1.10	1.08	6.76	6.62	8.23	7.70	19.29	17.47
DP2								

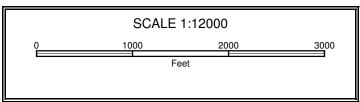

The following is a summary of the Retention Basin:

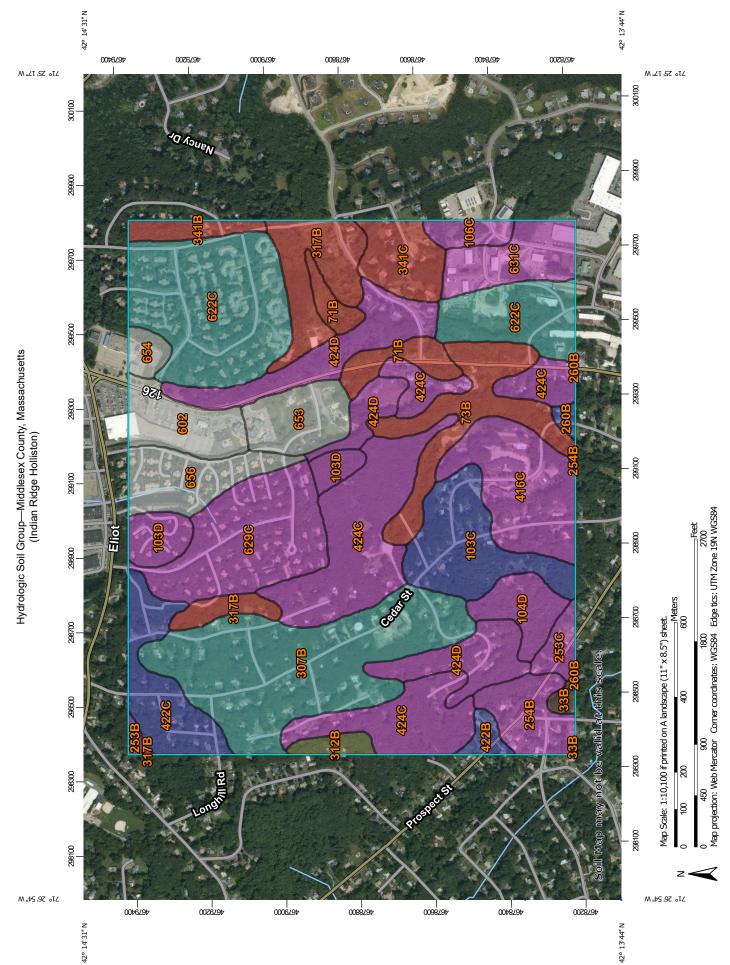

Summary of Retention Basin								
Design Point	<u>2-Yr V</u>	2-Yr Volume 10-Yr Volume 25-Yr Volume 100-Yr Volume						
	(cu.ft.)		(ac	(ac-ft) (ac-ft)		:-ft)	(ac-ft)	
	<u>Peak</u>	Outflow	<u>Peak</u>	Outflow	<u>Peak</u>	Outflow	<u>Peak</u>	<u>Outflow</u>
	Elev.Ft.	(cfs)	Elev. Ft.	<u>(cfs)</u>	Elev.Ft.	<u>(cfs)</u>	Elev.Ft.	<u>(cfs)</u>
1P	269.29	0.46	270.69	3.12	270.97	3.50	272.39	8.65

Summary:

The calculations performed for all design storm events indicate that the total peak rates and volumes of runoff for the Project as proposed will not exceed those of existing conditions with the implementation of the stormwater management system. With the implementation of the stormwater management system as designed, along with the Operation and Maintenance plan contained herein, all of the objectives of the DEP's Stormwater Management Regulations are satisfied.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Checklist for Stormwater Report

A. Introduction

Important: When filling out forms on the computer, use only the tab key to move your cursor - do not use the return key.

A Stormwater Report must be submitted with the Notice of Intent permit application to document compliance with the Stormwater Management Standards. The following checklist is NOT a substitute for the Stormwater Report (which should provide more substantive and detailed information) but is offered here as a tool to help the applicant organize their Stormwater Management documentation for their Report and for the reviewer to assess this information in a consistent format. As noted in the Checklist, the Stormwater Report must contain the engineering computations and supporting information set forth in Volume 3 of the Massachusetts Stormwater Handbook. The Stormwater Report must be prepared and certified by a Registered Professional Engineer (RPE) licensed in the Commonwealth.

The Stormwater Report must include:

- The Stormwater Checklist completed and stamped by a Registered Professional Engineer (see page 2) that certifies that the Stormwater Report contains all required submittals. This Checklist is to be used as the cover for the completed Stormwater Report.
- Applicant/Project Name
- Project Address
- Name of Firm and Registered Professional Engineer that prepared the Report
- Long-Term Pollution Prevention Plan required by Standards 4-6
- Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan required by Standard 8²
- Operation and Maintenance Plan required by Standard 9

In addition to all plans and supporting information, the Stormwater Report must include a brief narrative describing stormwater management practices, including environmentally sensitive site design and LID techniques, along with a diagram depicting runoff through the proposed BMP treatment train. Plans are required to show existing and proposed conditions, identify all wetland resource areas, NRCS soil types, critical areas, Land Uses with Higher Potential Pollutant Loads (LUHPPL), and any areas on the site where infiltration rate is greater than 2.4 inches per hour. The Plans shall identify the drainage areas for both existing and proposed conditions at a scale that enables verification of supporting calculations.

As noted in the Checklist, the Stormwater Management Report shall document compliance with each of the Stormwater Management Standards as provided in the Massachusetts Stormwater Handbook. The soils evaluation and calculations shall be done using the methodologies set forth in Volume 3 of the Massachusetts Stormwater Handbook.

To ensure that the Stormwater Report is complete, applicants are required to fill in the Stormwater Report Checklist by checking the box to indicate that the specified information has been included in the Stormwater Report. If any of the information specified in the checklist has not been submitted, the applicant must provide an explanation. The completed Stormwater Report Checklist and Certification must be submitted with the Stormwater Report.

¹ The Stormwater Report may also include the Illicit Discharge Compliance Statement required by Standard 10. If not included in the Stormwater Report, the Illicit Discharge Compliance Statement must be submitted prior to the discharge of stormwater runoff to the post-construction best management practices.

² For some complex projects, it may not be possible to include the Construction Period Erosion and Sedimentation Control Plan in the Stormwater Report. In that event, the issuing authority has the discretion to issue an Order of Conditions that approves the project and includes a condition requiring the proponent to submit the Construction Period Erosion and Sedimentation Control Plan before commencing any land disturbance activity on the site.

Massachusetts Department of Environmental Protection

Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

B. Stormwater Checklist and Certification

The following checklist is intended to serve as a guide for applicants as to the elements that ordinarily need to be addressed in a complete Stormwater Report. The checklist is also intended to provide conservation commissions and other reviewing authorities with a summary of the components necessary for a comprehensive Stormwater Report that addresses the ten Stormwater Standards.

Note: Because stormwater requirements vary from project to project, it is possible that a complete Stormwater Report may not include information on some of the subjects specified in the Checklist. If it is determined that a specific item does not apply to the project under review, please note that the item is not applicable (N.A.) and provide the reasons for that determination.

A complete checklist must include the Certification set forth below signed by the Registered Professional Engineer who prepared the Stormwater Report.

Registered Professional Engineer's Certification

I have reviewed the Stormwater Report, including the soil evaluation, computations, Long-term Pollution Prevention Plan, the Construction Period Erosion and Sedimentation Control Plan (if included), the Long-term Post-Construction Operation and Maintenance Plan, the Illicit Discharge Compliance Statement (if included) and the plans showing the stormwater management system, and have determined that they have been prepared in accordance with the requirements of the Stormwater Management Standards as further elaborated by the Massachusetts Stormwater Handbook. I have also determined that the information presented in the Stormwater Checklist is accurate and that the information presented in the Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Stormwater Report accurately reflects conditions at the site as of the date of this permit application.

Checklist for Stormwater Report

Checklist (continued)
 Standard 2: Peak Rate Attenuation
 ☐ Standard 2 waiver requested because the project is located in land subject to coastal storm flowage and stormwater discharge is to a wetland subject to coastal flooding.
 ☐ Evaluation provided to determine whether off-site flooding increases during the 100-year 24-hour storm.
 ☐ Calculations provided to show that post-development peak discharge rates do not exceed predevelopment rates for the 2-year and 10-year 24-hour storms. If evaluation shows that off-site flooding increases during the 100-year 24-hour storm, calculations are also provided to show that post-development peak discharge rates do not exceed pre-development rates for the 100-year 24-hour storm.

	nour storm.						
Sta	Standard 3: Recharge						
\boxtimes	Soil Analysis provide	ed.					
\boxtimes	Required Recharge	Volume calculation provided.					
	Required Recharge	volume reduced through use of	the LID site Design Credits.				
	Sizing the infiltration	, BMPs is based on the following	g method: Check the method used.				
	Static	Simple Dynamic	☐ Dynamic Field ¹				

\boxtimes	Runoff from all impervious areas at the site is not discharging to the infiltration BMP and calculations
	are provided showing that the drainage area contributing runoff to the infiltration BMPs is sufficient to
	generate the required recharge volume.

Recharge BMPs have been sized to infiltrate the Required Recharge Volume.

Runoff from all impervious areas at the site discharging to the infiltration BMP.

Recharge BMPs have been sized to infiltrate the Required Recharge Volume *only* to the maximum extent practicable for the following reason:

 $\hfill \square$ Site is comprised solely of C and D soils and/or bedrock at the land surface

M.G.L. c. 21E sites pursuant to 310 CMR 40.0000

☐ Solid Waste Landfill pursuant to 310 CMR 19.000

Project is otherwise subject to Stormwater Management Standards only to the maximum extent practicable.

Calculations showing that the infiltration BMPs will drain in 72 hours are provided.

Property includes a M.G.L. c. 21E site or a solid waste landfill and a mounding analysis is included.

¹ 80% TSS removal is required prior to discharge to infiltration BMP if Dynamic Field method is used.

Massachusetts Department of Environmental Protection

Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued

Standard 3: Recharge (continued)

The infiltration BMP is used to attenuate peak flows during storms greater than or equal to the 10-year 24-hour storm and separation to seasonal high groundwater is less than 4 feet and a mounding analysis is provided.
Documentation is provided showing that infiltration BMPs do not adversely impact nearby wetland resource areas.

Standard 4: Water Quality

The Long-Term Pollution Prevention Plan typically includes the following:

- Good housekeeping practices;
- Provisions for storing materials and waste products inside or under cover;
- Vehicle washing controls;
- Requirements for routine inspections and maintenance of stormwater BMPs;
- Spill prevention and response plans;
- Provisions for maintenance of lawns, gardens, and other landscaped areas;
- Requirements for storage and use of fertilizers, herbicides, and pesticides;
- Pet waste management provisions;
- Provisions for operation and management of septic systems;
- Provisions for solid waste management;
- Snow disposal and plowing plans relative to Wetland Resource Areas;
- Winter Road Salt and/or Sand Use and Storage restrictions;
- Street sweeping schedules;
- Provisions for prevention of illicit discharges to the stormwater management system;
- Documentation that Stormwater BMPs are designed to provide for shutdown and containment in the event of a spill or discharges to or near critical areas or from LUHPPL;
- Training for staff or personnel involved with implementing Long-Term Pollution Prevention Plan;
- List of Emergency contacts for implementing Long-Term Pollution Prevention Plan.

applicable, the 44% TSS removal pretreatment requirement, are provided.

\boxtimes	A Long-Term Pollution Prevention Plan is attached to Stormwater Report and is included as an attachment to the Wetlands Notice of Intent.
	Treatment BMPs subject to the 44% TSS removal pretreatment requirement and the one inch rule for calculating the water quality volume are included, and discharge:
	is within the Zone II or Interim Wellhead Protection Area
	is near or to other critical areas
	is within soils with a rapid infiltration rate (greater than 2.4 inches per hour)
	involves runoff from land uses with higher potential pollutant loads.
	The Required Water Quality Volume is reduced through use of the LID site Design Credits.
\boxtimes	Calculations documenting that the treatment train meets the 80% TSS removal requirement and, if

Massachusetts Department of Environmental ProtectionBureau of Resource Protection - Wetlands Program

Checklist (continued)

Checklist for Stormwater Report

Sta	andard 4: Water Quality (continued)
\boxtimes	The BMP is sized (and calculations provided) based on:
	☐ The ½" or 1" Water Quality Volume or
	☐ The equivalent flow rate associated with the Water Quality Volume and documentation is provided showing that the BMP treats the required water quality volume.
	The applicant proposes to use proprietary BMPs, and documentation supporting use of proprietary BMP and proposed TSS removal rate is provided. This documentation may be in the form of the propriety BMP checklist found in Volume 2, Chapter 4 of the Massachusetts Stormwater Handbook and submitting copies of the TARP Report, STEP Report, and/or other third party studies verifying performance of the proprietary BMPs.
	A TMDL exists that indicates a need to reduce pollutants other than TSS and documentation showing that the BMPs selected are consistent with the TMDL is provided.
Sta	ndard 5: Land Uses With Higher Potential Pollutant Loads (LUHPPLs)
	The NPDES Multi-Sector General Permit covers the land use and the Stormwater Pollution Prevention Plan (SWPPP) has been included with the Stormwater Report. The NPDES Multi-Sector General Permit covers the land use and the SWPPP will be submitted <i>prior</i> to the discharge of stormwater to the post-construction stormwater BMPs.
	The NPDES Multi-Sector General Permit does <i>not</i> cover the land use.
	LUHPPLs are located at the site and industry specific source control and pollution prevention measures have been proposed to reduce or eliminate the exposure of LUHPPLs to rain, snow, snow melt and runoff, and been included in the long term Pollution Prevention Plan.
	All exposure has been eliminated.
	All exposure has <i>not</i> been eliminated and all BMPs selected are on MassDEP LUHPPL list.
	The LUHPPL has the potential to generate runoff with moderate to higher concentrations of oil and grease (e.g. all parking lots with >1000 vehicle trips per day) and the treatment train includes an oil grit separator, a filtering bioretention area, a sand filter or equivalent.
Sta	ndard 6: Critical Areas
	The discharge is near or to a critical area and the treatment train includes only BMPs that MassDEP has approved for stormwater discharges to or near that particular class of critical area.
П	Critical areas and BMPs are identified in the Stormwater Benort

Massachusetts Department of Environmental Protection

Bureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

Checklist (continued)

andard 7: Redevelopments and Other Projects Subject to the Standards only to the maximum ent practicable
The project is subject to the Stormwater Management Standards only to the maximum Extent Practicable as a:
☐ Limited Project
 ☐ Small Residential Projects: 5-9 single family houses or 5-9 units in a multi-family development provided there is no discharge that may potentially affect a critical area. ☐ Small Residential Projects: 2-4 single family houses or 2-4 units in a multi-family development with a discharge to a critical area ☐ Marina and/or boatyard provided the hull painting, service and maintenance areas are protected
from exposure to rain, snow, snow melt and runoff
Bike Path and/or Foot Path
Redevelopment Project
Redevelopment portion of mix of new and redevelopment.
Certain standards are not fully met (Standard No. 1, 8, 9, and 10 must always be fully met) and an explanation of why these standards are not met is contained in the Stormwater Report. The project involves redevelopment and a description of all measures that have been taken to improve existing conditions is provided in the Stormwater Report. The redevelopment checklist found in Volume 2 Chapter 3 of the Massachusetts Stormwater Handbook may be used to document that the proposed stormwater management system (a) complies with Standards 2, 3 and the pretreatment and structural BMP requirements of Standards 4-6 to the maximum extent practicable and (b) improves existing conditions

Standard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control

A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan must include the following information:

- Narrative;
- Construction Period Operation and Maintenance Plan;
- Names of Persons or Entity Responsible for Plan Compliance;
- Construction Period Pollution Prevention Measures;
- Erosion and Sedimentation Control Plan Drawings;
- Detail drawings and specifications for erosion control BMPs, including sizing calculations;
- Vegetation Planning;
- Site Development Plan;
- Construction Sequencing Plan;
- Sequencing of Erosion and Sedimentation Controls;
- Operation and Maintenance of Erosion and Sedimentation Controls;
- Inspection Schedule;
- Maintenance Schedule:
- Inspection and Maintenance Log Form.
- A Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan containing the information set forth above has been included in the Stormwater Report.

Massachusetts Department of Environmental ProtectionBureau of Resource Protection - Wetlands Program

Checklist for Stormwater Report

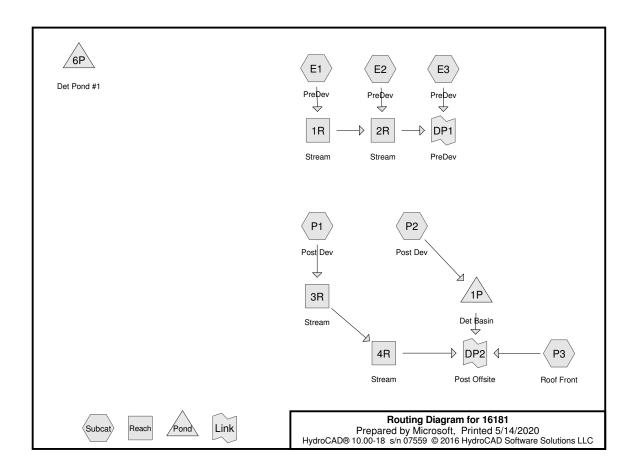

Checklist (continued)

	Indard 8: Construction Period Pollution Prevention and Erosion and Sedimentation Control ntinued)								
	The project is highly complex and information is included in the Stormwater Report that explains why it is not possible to submit the Construction Period Pollution Prevention and Erosion and Sedimentation Control Plan with the application. A Construction Period Pollution Prevention and Erosion and Sedimentation Control has <i>not</i> been included in the Stormwater Report but will be submitted <i>before</i> land disturbance begins.								
	The project is <i>not</i> covered by a NPDES Construction General Permit.								
	The project is covered by a NPDES Construction General Permit and a copy of the SWPPP is in the Stormwater Report.								
	The project is covered by a NPDES Construction General Permit but no SWPPP been submitted. The SWPPP will be submitted BEFORE land disturbance begins.								
Standard 9: Operation and Maintenance Plan									
	The Post Construction Operation and Maintenance Plan is included in the Stormwater Report and includes the following information:								
	Name of the stormwater management system owners;								
	□ Party responsible for operation and maintenance;								
	Schedule for implementation of routine and non-routine maintenance tasks;								
	☑ Plan showing the location of all stormwater BMPs maintenance access areas;								
	□ Description and delineation of public safety features;								
	□ Estimated operation and maintenance budget; and								
	○ Operation and Maintenance Log Form.								
	The responsible party is <i>not</i> the owner of the parcel where the BMP is located and the Stormwater Report includes the following submissions:								
	A copy of the legal instrument (deed, homeowner's association, utility trust or other legal entity) that establishes the terms of and legal responsibility for the operation and maintenance of the project site stormwater BMPs;								
	A plan and easement deed that allows site access for the legal entity to operate and maintain BMP functions.								
Sta	ndard 10: Prohibition of Illicit Discharges								
	The Long-Term Pollution Prevention Plan includes measures to prevent illicit discharges;								
	An Illicit Discharge Compliance Statement is attached;								
	NO Illicit Discharge Compliance Statement is attached but will be submitted <i>prior to</i> the discharge of any stormwater to post-construction BMPs.

APPENDIX – C

Stormwater Recharge Calculations, Water Quality Volumes, TSS Removal & Infiltration BMP Drain Time Groundwater Mounding Calculations

Standards 3 & 4:

APPENDIX - B

Stormwater Recharge, Water Quality & Forebay Calculations Standard 3 & 4:

Project:

Geofrey Park

Holliston, Massachusetts Date: May 14, 2020

Water Quality Volume (WQV): Based on 0.5 inch rainfall

Recharge Volume(Rv): Based on Soil Classification

Rv = F * Impervious Area

Rv = Required Recharge Volume

F = Depth Factor

Soil Type A – 0.60 inch

Soil Type B – 0.35 inch

Soil Type C – 0.25 inch

Soil Type D - 0.00 inch

Total Impervious Area:

Roadway/Drives: 63,408 s.f. (To drainage basin)

 Roof: (to basins)
 30,966 s.f

 Roof: (bypass basin)
 5,824 s.f.

 Total Imp. Area:
 100,198 s.f.

Total Impervious to Recharge Basins: 94,374 s.f.

Total Impervious Area Uncaptured:

l: 5,824 s.f.

Capture Adjustment:

94,374 s.f. / 100,198 s.f. = 94.2% > 65%

100,198 s.f. / 94,374 s.f. = 1.06 capture adjustment

Drainage Basin #1:

Imp. Area Pavement: 63,408 s.f.

WQV = (63,408 sf * 0.5 in)/12 = 2642 c.f.

Recharge Volume Required: (Soil Type B – 0.35 inch)

Tot. Imp Area: 94,374 s.f.

 $Rv = (94,374 \text{ sf} * 0.35 \text{ in})/12 = 2752 \text{ c.f.} \times Capture Adjustment } (1.06) = 2,918 \text{ c.f.}$

Storage Volume below outlet

"Static" Storage Volume Provided:

Volume (Outlet 268.2) provided = 5,510 c.f.

5,510 > 2,918 c.f. **OK**

Time to drain:

Drawdown time = Volume/(K*Bottom Area)

Volume = 2918 cf

K=1.02 in/hr = 0.085 ft/hr

Bottom Area = 3620 sf (El.268.0)

Drawdown time = $2918/(0.085 \text{ ft/hr } \times 3620 \text{ sf})$

Drawdown time = 9.5 hr < 72 hr ok

This spreadsheet will calculate the height of a groundwater mound beneath a stormwater infiltration basin. More information can be found in the U.S. Geological Survey Scientific Investigations Report 2010-5102 "Simulation of groundwater mounding beneath hypothetical stormwater infiltration basins".

The user must specify infiltration rate (R), specific yield (Sy), horizontal hydraulic conductivity (Kh), basin dimensions (x, y), duration of infiltration period (t), and the initial thickness of the saturated zone (hi(0), height of the water table if the bottom of the aquifer is the datum). For a square basin the half width equals the half length (x = y). For a rectangular basin, if the user wants the water-table changes perpendicular to the long side, specify x as the short dimension and y as the long dimension. Conversely, if the user wants the values perpendicular to the short side, specify y as the short dimension, x as the long dimension. All distances are from the center of the basin. Users can change the distances from the center of the basin at which water-table aquifer thickness are calculated.

Cells highlighted in yellow are values that can be changed by the user. Cells highlighted in red are output values based on user-specified inputs. The user MUST click the blue "Re-Calculate Now" button each time ANY of the user-specified inputs are changed otherwise necessary iterations to converge on the correct solution will not be done and values shown will be incorrect. Use consistent units for all input values (for example, feet and days)

use consistent units (e.g. feet & days or inches & hours)

- 1	nput Values			inch/hour feet/d	ay
	1.2100	\boldsymbol{R}	Recharge (infiltration) rate (feet/day)	0.67	1.33
	0.210	Sy	Specific yield, Sy (dimensionless, between 0 and 1)		
	20.40	K	Horizontal hydraulic conductivity, Kh (feet/day)*	2.00	4.00 In the report accompanying this spreadsheet
	76.000	x	1/2 length of basin (x direction, in feet)		(USGS SIR 2010-5102), vertical soil permeability
	37.000	У	1/2 width of basin (y direction, in feet)	hours days	(ft/d) is assumed to be one-tenth horizontal
	1.000	t	duration of infiltration period (days)	36	1.50 hydraulic conductivity (ft/d).

Disclaimer

This spreadsheet solving the Hantush (1967) equation for ground-water mounding beneath an infiltration basin is made available to the general public as a convenience for those wishing to replicate values documented in the USGS Scientific Investigations Report 2010-5102 "Groundwater mounding beneath hypothetical stormwater infiltration basins" or to calculate values based on user-specified site conditions. Any changes made to the spreadsheet (other than values identified as user-specified) after transmission from the USGS could have unintended, undesirable consequences. These consequences could include, but may not be limited to: erroneous output, numerical instabilities, and violations of underlying assumptions that are inherent in results presented in the accompanying USGS published report. The USGS assumes no responsibility for the consequences of any changes made to the spreadsheet. If changes are made to the spreadsheet, the user is responsible for documenting the changes and justifying the results and conclusions.

APPENDIX – D

Stormwater Operation and Maintenance Plan and Long Term Pollution Prevention Plan

Standard 9

Holliston, Massachusetts

<u>Stormwater Management Operation and Maintenance Plan</u> And Long Term Pollution Prevention Plan

Maintenance Agreement Geoffrey Park Holliston, Massachusetts

May 14, 2020

In accordance with Standard 9 of the Massachusetts Department of Environmental Protection Stormwater Handbook (February 2008), the attached on-site maintenance program for the proposed stormwater management system has been developed to ensure the Best Management Practices (BMP's) in place will remain functioning as designed. The landowner/operator, or its successors, of the Project Site, Geoffrey Park shall be responsible for financing maintenance and emergency repairs of the entire storm-water management system on the property. The Plan contains both construction period operations and maintenance as well as post construction responsibilities that shall "run" with the property if ownership is transferred.

Responsible Operator:

Indian Ridge Realty Trust Attn: David Adams 223 Courtland Street Holliston, MA 01746 Office: 508-561-4197

David Adams	Date
Estimated Maintenance Yearly Budget:	
Annual Catch Basin and Stormceptor Cleaning:	\$ 1,500.00
Mowing, vegetation maintenance of Drainage Basin:	\$ 480.00
Repairs:	\$ 250.00
Total	\$ 2,230.00

Construction Period Operation and Maintenance:

Good Housekeeping Practices:

- Remove all debris from site and dispose of in trash dumpsters
- Plan for adequate disposal of scrap, waste and surplus materials
- Keep work area clean
- Secure loose or light material that is stored on the site
- Store flammable materials apart from other materials
- Secure all materials at the end of each work day
- Maintain a clean neat and orderly site

Safety:

Keep safety considerations at the forefront of inspection procedures at all times. Likely hazards should be anticipated and avoided. Never enter a confined space (outlet structure, manhole, etc) without proper training or equipment. A confined space should never be entered without at least one additional person present. If a toxic or flammable substance is discovered, leave the immediate area and contact the local authorities at 911.

All cast iron storm water structure grates and covers shall be kept in good condition and kept closed at all times. Any damaged or broken structures will be replaced immediately upon discovery.

Construction Entrances:

The purpose of stabilizing entrances to a construction site is to minimize the amount of sediment leaving the area as mud and sediment attached to vehicles. The entrances shall be sized according to the Massachusetts DEP and US EPA guidelines and will be maintained on a weekly basis during construction. A Detail is included in the Site Plans prepared for the Project.

Dust Control:

Soils information for the site indicates that it is comprised of sandy soils. Therefore, Dust control BMPs to reduce surface activities and air movement that causes dust to be generated from disturbed soil surfaces will be required. The preferred measure for dust control is sprinkling/irrigation. This is an on-going/as-needed requirement until surfaces have been stabilized. There shall be a water truck on-site available as needed.

Catch Basin Protection:

Temporary inlet protection barriers consisting of Silt Sacks® will be placed within all constructed inlets to prevent inflow of sediments into the constructed drainage system. The barriers shall remain in place until a permanent cover is established or diversions away from the inlets are constructed. The barriers shall be observed and maintained as necessary on a weekly basis and after every rainfall of 0.5 inches or more.

Holliston, Massachusetts

Spill Control:

A contingency plan to address the spillage/release of petroleum products and any hazardous materials will be implemented for the site during construction. The plan will include the following measures:

- Equipment necessary to quickly attend to inadvertent spills or leaks shall be on-site in a secure but accessible location. Such equipment will include, but not be limited to, the following: urethane drain cover seals (mats), a spill containment kit which includes sand and shovels, suitable absorbent materials, storage containers, safety goggles, chemically resistant gloves and overshoe boots, water and chemical fire extinguishers, and first aid equipment.
- Spills or leaks will be treated properly according to material type, volume of spillage and location of spill. Mitigation will include preventing further spillage, containing the spilled material to the smallest practical area, removing spilled material in a safe and environmentally friendly manner, and remediating any damage to the environment.
- The contractor shall be familiar with the reporting requirements of the Massachusetts
 Contingency Plan (310 CMR 40.00) as issued by the Massachusetts Department of
 Environmental Protection (DEP); specifically Subpart C Notification of Releases and Threats
 of Release of Oil and Hazardous Materials and Subpart D Preliminary Response Activities and
 Risk Reduction Measures.
- For any large spills. The Massachusetts DEP Hazardous Waste Incident Response Group shall be notified immediately at 1-617-792-7653 and an emergency response contractor will be called in.

Post-Construction Period Operation and Maintenance:

Pavement Sweeping:

Sweeping has been shown to be an effective initial treatment for reducing contaminants in stormwater runoff. Sweeping is not required to meet TSS removal goals in this case but should be performed at least once per year, in the spring to remove winter accumulations or at other when warranted.

Stormceptor STC450i Treatment Catch Basin Units:

Sediments, associated pollutants and trash are removed only when inlets or sumps are cleaned out, so regular maintenance is essential. Cleaning includes removal of accumulated oil and grease and sediment using a vacuum truck or other ordinary catch basin cleaning device. In areas of high sediment loading, inspect and clean inlets after every major storm. At a minimum, inspect oil grit separators and clean them out at least twice per year. Cleaning of a Stormceptor systems should be done during dry weather conditions when no flow is entering the system. The use of a vacuum truck is generally the most effective and convenient method of removing pollutants from the system.

Stormceptor Treatment Units:

Activity	Inspection Frequency
Inspect Inlet and Outlet	2 times per yr. After a heavy rain event 1" storm or larger
Sediment buildup & Clean	2 times per yr. (minimum) Accumulated sediment buildup shall be Vacuumed cleaned as necessary

Detention/Retention Basin:

Vehicle access if necessary will be via the access around the top of the retention basin. The drainage easement shall be mowed twice a year and kept clear of any trees. The easement will be used for access to the basin.

Inspect it after every major storm for the first few months to ensure it is stabilized and functioning properly and if necessary to take corrective action. Also inspect the basin every time there is a discharge through the high outlet weir. A major storm is defined as a storm that is equal to or greater than the 2.5 inches in a 24-hour storm. Note how long the water remains standing after a storm. If longer than 72 hours, there may be clogging of the infiltrative surfaces. Inspect the basin and mow it as needed. When mowing keep the grass height no greater than 6 inches. Set mower blades no lower than 3 to 4 inches. Remove grass clippings, organic matter and trash. Use deep tilling to break up compacted or clogged surfaces.

Check for signs of gullying and repair as needed. After removing the sediment, replace any vegetation damaged during the clean-out by reseeding.

Holliston, Massachusetts

Retention Basin:

	Inspection
Activity	Frequency
Sediment Removal	Inspect Monthly
	Remove accumulated sediment buildup
	Grass Mowing during growing season
	(Keep grasses no greater than 6 inches & no lower than
	3 to 4 inches)

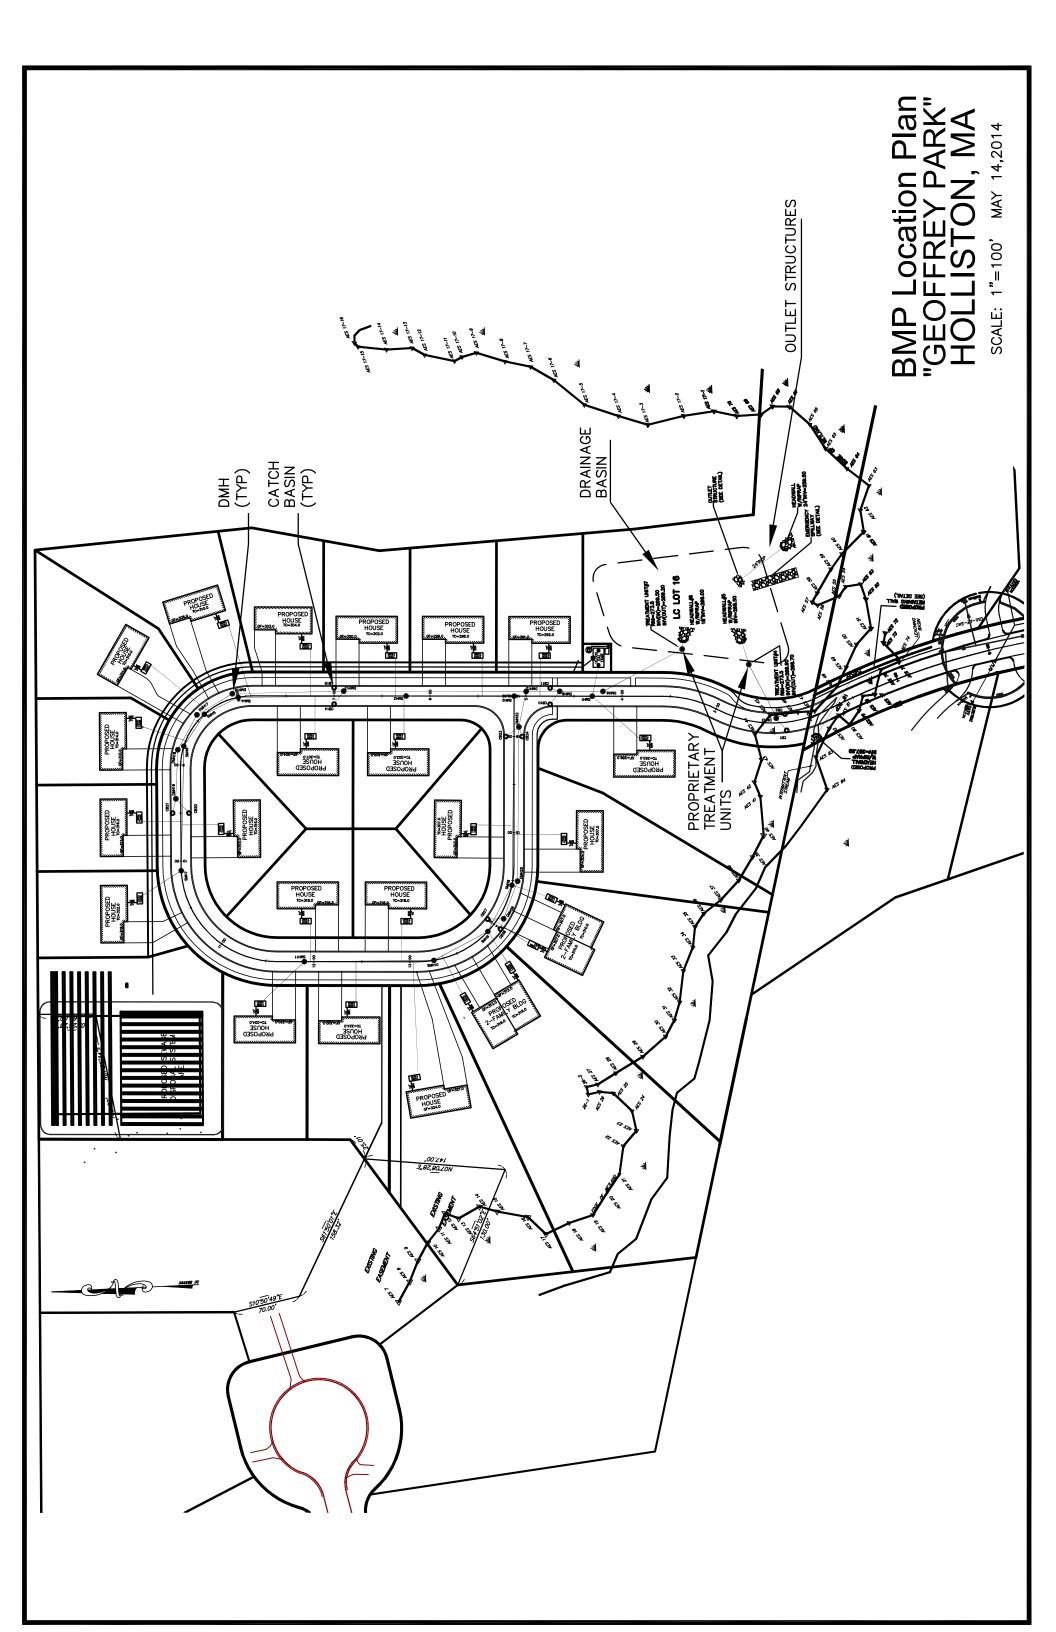

Snow Removal and De-icing:

Snow shall be stored in the designated areas shown on the site plans. If snow accumulation exceeds the limits of the storage areas, excess snow shall be removed from the site and disposed of in a proper manner.

The use of Sodium Chloride ("rock salt") for de-icing of paved surfaces will be limited; except when found to be necessary for safety of the residents. Sand will be the primary icing control agent. Alternative de-icing products such as calcium chloride may be used as temperatures or other conditions warrant.

Fertilizer:

Slow release organic fertilizers will be used in landscape areas to limit nutrient transport to groundwater and wetland areas. Application will be limited to 3 lbs. per 1000 sf of lawn area.

<u>APPENDIX – E</u>

Illicit Discharge Statement

Standard 10

Holliston, Massachusetts

Illicit Discharge Compliance Statement

Geoffrey Park Holliston, Massachusetts

May 14, 2020

This statement is provided in accordance with the provisions of the Massachusetts Stormwater Management Standard #10.

To the best of the applicant's/owners knowledge there are no illicit discharges to the site's stormwater manangement system.

All proposed uses on the site will not generate, store or discharge any pollutants to the groundwater and/or wetland resource areas.

Any illicit discharges identified during or after construction will be terminated immediately.
